EXPERIENCE

Moip (Wirecard Brazil), 2015 - current

Software Developer (Remote)

- **Moip mPOS (Android)**
As a lead developer, I am responsible for the architecture and development while working closely with the UX/UI team. The mPOS app is a Point of Sale app that uses bluetooth connection with pinpads so that sellers can use Moip as an end-to-end payment system in their physical stores.
- **Moip mPOS SDK (Android)**
Developing the mPOS SDK that communicates directly with APIs and payment gateway through a SDK. It is used by Moip's mPOS app as well as by third party developers who may need a white-label Point of Sale solution on their own apps.
- **Moip account (Android)**
Providing maintenance for a previously built app while improving it with new features, such as invoice issuing and bill payment via barcode scanning.
- **Backend APIs**
Creating new microservices for and adding features in Moip's APIs, where most of them were used by the mobile apps. Some of the technologies used: AWS, Kotlin, Java, Ruby, RabbitMQ, Mongo DB.
